How much one more characteristic adds to dataset size
in predicting which family is closer to the truth
dashed lines: dataset size alone; synthetic datasets, held-out folds
market weights
uniform weights
dataset size alone
dispersion
dispersion (uniform)
critical bandwidth
critical bandwidth (uniform)
skewness (uniform)
kurtosis (uniform)
entropy (uniform)
normal fit (uniform)
market-weighted mean
W1, uniform vs market
0.0
0.2
0.4
0.6
share of the variation explained, on datasets not used to fit
