

Even under the best method a probabilistic LCA is right to 12.6 pct on the design comparison and wrong by 32.4 pct on which material leads, and switching family by dataset size is closest on 10 of 16 claims among the options a reader has

black box: closest of all seven.
dashed box: closest of the four a reader can choose.
* needs product-level market shares, which nobody publishes: what the missing data is worth, not a method.
the size rule switches family anywhere from 40 to 170 EPDs.

but that count is an average over every dataset size, and the ordering inverts

the seven per-material claims pooled: each cell is one method in one size band, 2,500 materials
